# The VersaWave<sup>®</sup> Dental Laser...

## A Stress-Free Dental Experience!

*The Patient-friendly alternative  
to the drill*

### ***Dentistry now uses VersaWave<sup>®</sup> Technology***

If you have tooth decay, you want to treat it as soon and as painlessly as possible. Your dentist has made a commitment to your dental health by offering the VersaWave<sup>®</sup> Dental Laser. The VersaWave<sup>®</sup> offers you the opportunity to have a safe, anxiety free dental experience, without drills, and in most cases, without anesthesia.

### ***How does the laser work?***

The VersaWave<sup>®</sup> removes and treats all dental tissue with the energy of light. The specialized light produced by the VersaWave<sup>®</sup> laser is rapidly absorbed by the water molecules in soft tissue. In the case of treating a cavity, the laser gently removes the decay, leaving more of the healthy tooth.

### ***How is the laser different than the drill?***

The drill is a very powerful mechanical tool, and the vibration and large hole it produces causes discomfort. Anesthesia is almost always needed. The VersaWave<sup>®</sup> is an alternative which offers the patient the latest in technological advances. The laser light works to destroy and remove the decay without the vibration and resulting discomfort. Rather than a drilling sound, you hear only a gentle tapping.

### ***Will I still need anesthesia?***

Probably not! Most patients require no injected anesthesia when the VersaWave<sup>®</sup> is used to remove decay. This means that you will not have to spend time waiting for numbing to take effect or to wear off. Additionally, multiple teeth in different parts of your mouth can be worked on in ONE visit. You may still choose to have anesthesia, while still avoiding the sound and vibration of the drill.

### ***Is the laser safe?***

Absolutely, the treatment has proven to be appropriate and safe in over tens of thousands of applications throughout the world. The laser is ideal for both adults and children.

### ***What else can the laser treat?***

The VersaWave<sup>®</sup> is effective for soft tissue procedures on the gums, cheeks and tongue with less pain, less bleeding and faster healing times. The laser is used in a variety of endodontic (root canal) procedures as well.

### ***How do I get started?***

Your dentist will be happy to discuss the VersaWave<sup>®</sup> treatment options with you.
